Web-based GIS Application for International Cooperation Project Management

International Cooperation projects play an important role as support of Integral Rehabilitation of the Historical Centre of Havana, Cuba. In this work, the application development process and main characteristics of web-based GIS application for international cooperation project management are presented. This application enables the International Cooperation Division to evaluate their results from a geographic point of view and serves to support the decision-taking process. It also shows many thematic maps about the benefits generated by the international cooperation projects. There are two types of users for these applications, namely, Contributors who can consult the Internet Division's web page and Specialists in the Project Management Division, who now have an available tool that will allow them to improve their job. This work was supported by the Swiss Agency for Development and Cooperation (SDC)
