How to fit 5 Kilos of Software into a 1.3 Kilo Box

Thursday 14 Sep 2006 at 12:00 (00h30')

The Macintosh Mini is an attractive platform that can be turned into a geospatial server appliance. This
presentation will talk about our experience in loading up a Mac Mini with a variety of FOSS Geo packages, writing
some scripts to glue it all together, and setting it loose with several hundred GBytes of storage. Can this
unassuming little box work its way into the hearts and minds of the Civil Society community?
